

ABSTRACT

A system for creating and deleting reminders to perform a task which requires the movement of an object from a first location to a second location. An indicator is attached to the object, a first sensor is mounted adjacent the first location for detecting the indicator and outputting a signal in response thereto. A second sensor is mounted adjacent the second location for detecting the indicator and outputting a signal in response thereto. A monitor includes a program which generates a reminder to perform the task in response to a signal from the first sensor, and cancels the reminder in response to a signal from the second sensor.
